

[EATSE-80254] Double delivery : Upsell non food with food order

- Ticket: [EATSE-80254](#)
- Figma : <https://www.figma.com/design/YGPvLYIYk9Ralx6bZ2ruKC/-EATSE-80254---Customer--Double-dash?t=2eBZSbxbE6h9FiFJ-0>

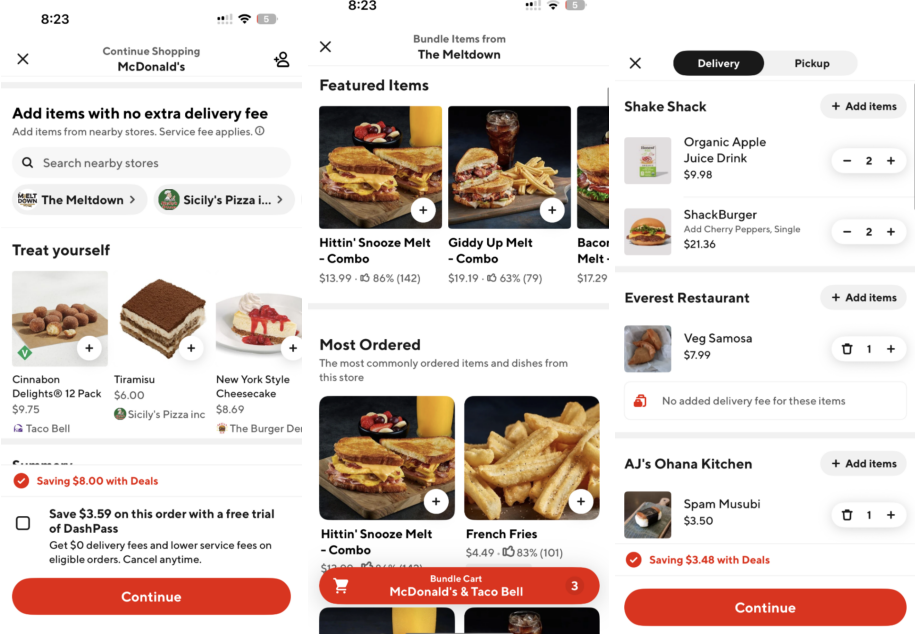

Context/Problem:

Users may be looking outside Eats for drinks or desserts that go with their main dish, which could mean we’re missing potential upsell opportunities. Benchmarks including Uber Eats and DoorDash suggest complementary items (beverages, desserts, alcohol) in their cart or checkout flow to capture this demand

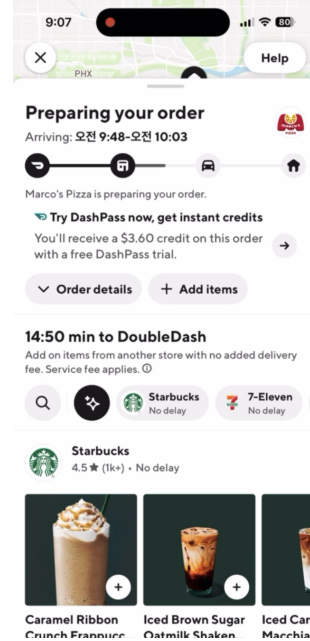

UberEats: RT

Doordash: Cart (before placing order)

Doordash: RT (after placing order)

Solution:

So, we'll surface recommended items from non-food stores that are either along the initial route or nearby and can complement the dishes the customer is originally trying to order. We'll start by showcasing non-food stores as a channel to acquire non-food users and highlight coupons for non-food store at RT page.

A- How to discover and order add-on items:

#1 - (P0) WoW customers will see the bottom sheet showcasing "nonfood" stores/dishes at RT as soon as the merchant accepts the food order

- 1-1. (P0) Depending on how we control the existing bottom sheet, the user group will be divided into version B and version C.
- 1-2. (P1 > excluded from the initial launch scope) For users in group B, to prevent conflicts with the existing feature, the area that was previously displayed as a bottom sheet will be changed to a popup. Once the existing pop-up is displayed and shut down, the bottom sheet upselling non-food will automatically slides up
- 1-3. (P0) For users in group C, the area that was previously displayed as a bottom sheet will disappear. and the bottom sheet upselling non-food will automatically slides up
- 1-4. (P0) The bottom sheet is displayed only when there are 2 or more non-food stores that can be recommended.

#2 - (P0) Except for the initial visit after the merchant accepts, it should remain collapsed.

#3 - (P0) the user can "add" non-food order to cart via RT only before **15 mins have passed** since the merchant accepts the previous order

- 3-1. (P0) If no non-food items are in the cart via RT after 15 mins have passed, the bottom sheet will disappear.
- 3-2. (P0) If non-food items are in the cart via RT after 15 mins have passed, keeping the bottom sheet visible without the countdown
- 3-3. (P0) Once 15 mins have passed, comms related to double delivery should no longer be shown on SFP, PDP, or CART (refreshed to the original flow)
- 3-4. (P0) If there are items in CART added through DD bottom sheet at RT, DD comm should be displayed when visiting the cart (regardless of entry points) If there are no items added through DD, DD comm should not be displayed.

#4 - (P0) At the title, will display how much savings the customer could get when placing a non-food order.

- 4-1. The savings will be pulled from the best available single coupon amount among coupons set at [MARTS_FIRST_PURCHASE_COUPON_1](#) for non-food 1st purchaser users.
- 4-2. coupon will be automatically downloaded at the moment when the bottom sheet slides up.
- 4-3. If the user is not non-food 1st purchaser user, savings within the title area will not be shown

#6 -(P0) If the original delivery is free delivery, there will be 0-5 time added. If it's a direct delivery, we'll indicate that it may take about 5-10 minutes longer

#7 -(P0) When customers click the 'add to cart' CTA for non-food stores at RT, they will be redirected to PDP for items with no option and SFP for items with option.

- 6-1. (P1 > but will be included in 13th next app release)When the MOA is not yet satisfied, a gauge is displayed at SFP to prompt the user to add additional items
- 6-2. After adding dishes to cart, they will be navigated to SDF and taken back to cart page upon click on CTA at the bottom of SDF or X button on the top

#8 - (P0) If items have been added, the user can access the cart again from the RT, and the CTA will display the number of items and the amounts that have been added at RT

#9 - (P0) If the user is on DD's SFP, PDP, or CART page at the moment a food order is canceled, the user will be informed through a pop-up.

B- OHP/RT - Tracking 2 orders

#10 - Will add nudge that navigate from one RT page to another RT page

#11 - Show that the delivery is handling another order with a bubble tip at RT2 when picking food at P1 and heading to P2:

	Order1	Order2	RT1	RT2	Bubble Tip on map screen
P0	Delivery assigned	Delivery assigned	Heading to store	Heading to store	RT2: Handling double delivery order(TBD)
P1	Delivery picked up	Delivery assigned	Picking up your order	Heading to store	RT2: Handling double delivery order(TBD)

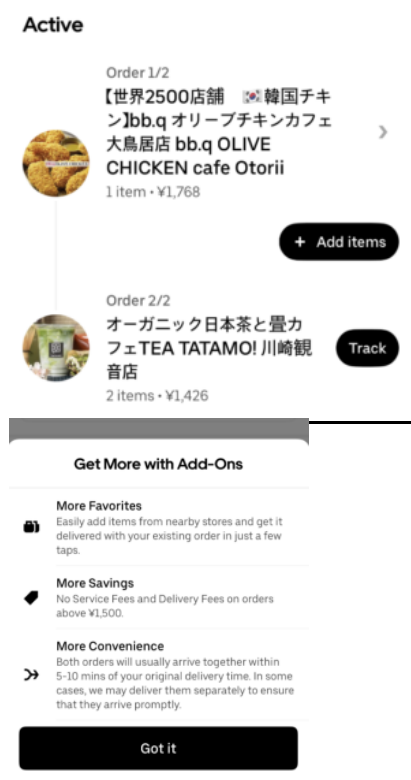

#12 - If the food order has been canceled, inform the customer that the order has been canceled before providing guidance about the cancellation through OHP

13- (Push notification) If the same driver was assigned to both orders, push messages is sent only once driver was assigned to both orders instead of sending multiple duplicate message

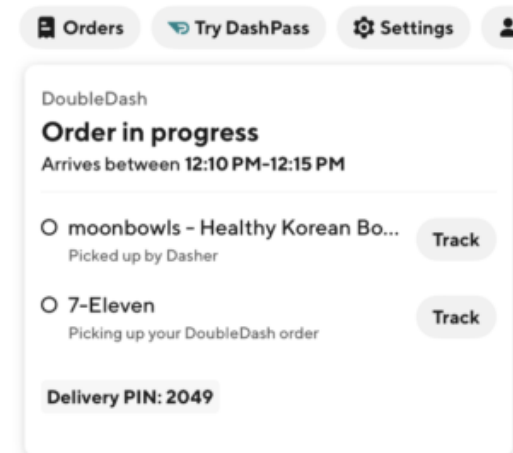

- 13-1. The pickup complete, nearby, and delivery complete push notifications are each sent only once and at the moment both status are updated to same one.
- 13-2. those 3 notification contents will be displayed based on the non food order once
- 13-3. Will sending separate messages that correspond to each Food and NON food order if two order are assigned to different drivers

14- (Dynamic Island) the status of each order can be checked separately

UberEats:

DoorDash:

Metrics & Test plan:

- Will run AB in high store density areas such as Gangnam/Seocho/Songpa
- Success metrics
 - the number of non food orders
- Guardrail metrics : buyer conversion
