

KR Chat: Post-test

Problem

1. **Consent rate** is at a low level, 56% (based on Aug 11 data) and ignoring consent rate is at c.35%
2. Out of 894 orders with Chat (based on Aug 12 data),
 - a. 306 (34%) were chats with only the customer sending message
 - i. This issue needs to be further probed to understand its root cause
 - b. 449 (50%) were chats with only the courier sending message
 - i. This is being rectified by the Customer team by trying to improve on the consent rate of the customer

Problem Analysis: Low consent rate

1. Method of gaining consent:
 - a. Pop-up in the GW

- b. Once delivery is in-progress, user can click on the chat icon then give consent

- i.
2. **Web logs analysis:**
 - a. There is a discrepancy in the data between FE and BE (potentially due to test being done in one region)
 - Agree consent courier count
 - FE: 2,121 (6/30 ~ 8/24)
 - BE: 2,210 (6/30 ~ 8/24)
 - Disagree consent courier count
 - FE: 297 (6/30 ~ 8/24)
 - BE: 2 (6/30 ~ 8/24)
 - b. We have verified that disagree count in the BE is incorrect due to API not being in place
 - i. But have confirmed that FE and BE data for agree count is similar
 - ii. So, we have enough rationale to look at the FE as a credible source
 - c. From FE, the following are the key metrics
 - **Active courier: 4,333**
 - **Impression of chat consent pop-up count: 3,244**
 - Agree count: 2,121
 - Disagree count: 297

- **Ignore count: 826**
- d. Difference between Active courier count and Impression count = 1,089 (4333 - 3244)
 - c.30 are couriers who have lower version that cannot access chat
 - c.1,150 are couriers who had launched the app and bypassed the GW
 - Have app open and then entered Sokcho
 - Clicked on a push notification and landed straight into a page other than the GW
- e. Ignore count of 826 (25%)
 - Finding:
 - It is very difficult to understand how they ignored but most likely, they were not usual drivers within TR and none had delivered within the TR before and after seeing the consent
 - None of them delivered in Sokcho after seeing pop-up meaning that they probably didn't intentionally ignore the popup and have no intention to deliver in Sokcho
 - Back-up:
 - 598/826 ignored the consent only once
 - 281/598 delivered order outside of TR 7 days before seeing the consent pop-up
 - None delivered within the TR
 - All 598 did not do any deliveries in the TR after they saw the pop-up
 - Although 46 of them delivered outside of TR after seeing the consent
 - 227/826 ignored the consent more than once
 - 98/227 delivered at least once outside of TR 7 days before seeing the consent pop-up
 - 20/227 couriers made a delivery after seeing the consent all outside of the TR but none within the TR
 - Action:
 - **AI: Call these 20 people (if not 227) to see how and why they ignored the consent**
 - Roll the chat feature out nationwide and monitor if the ignore count reaches to a level of concern
 - How to ignore
 - Hypothesis
 - Enter TR → Open the app → See pop-up → Do nothing and kill the app → Exit TR → Open the app
- f. Instead, there can be efforts made to improve on the Disagree count
 - i. **AI: Find out why people have rejected → How to improve on the reject rate**

AI: Ensure that the superset dashboard is updated with the right delivery region ID's

Problem Analysis: Low read rate

AI: Compare the read and response data between KR and JP; ensure the formula for the dashboard between the two are equal

1. Chats only with messages from the customer

- a. Out of 306, 225 (c.73%) were due to: EDP did give consent but did not read the message
- b. Out of 306, 231 (c.75%) were single message sent by the customer (total message count=1)
 - i. This means that push / in-app bar would have been sent/displayed
 - ii. All messages were sent in the last 4 minutes of delivery, before drop-off - which can imply that users would have had their app on the foreground when they received the message (data)
 - 1. Plus 90% were Android users - meaning that they did not receive the push when the app was in the foreground (data)
 - 2. Around 82% of messages sent from the customer were messages with a response not necessarily expected (i.e. not a question)
- Hypothesis:
 - Couriers did not read the message because they did not realise there was a message sent
 - Couriers did not read the message because they saw the preview of the message through the push notification and felt that response was not required
 - Couriers did not read the message because they were at the near end of their delivery and thought they could respond in person

2. Qualitative interview finding (25 Aug, 2 participants, age: 50s and above and vehicle type: car)

- Both interviewees were not aware of any message being received

3. Data comparison between JP and KR (data)

	A	B	C	D	E
1	6/30 ~ 9/02	KR		JP	
2	Orders with chat	1,148		87,097	
3	Message from customer only chat count	408	35.54%	13,039	14.97%
4	- EDP gave consent and read msg	107	26.23%	6,171	47.33%
5	- EDP gave consent but didn't read msg	298	73.04%	6,868	52.67%
6	- EDP didn't give consent	3	0.74%	0	0.00%
7	Single message chat by customer	308	75.49%	10,100	77.46%
8					

- Caveat: The sample size is significantly different meaning that the data analysis may not be very reliable, but it does give us a picture:
 - The percentage of chats with only customer messages are lower in KR
 - Message read rate is also lower in KR compared to JP
- This may indicate that we need to provide KR users a larger degree of handholding to get them to use the chat
 - This is likely given that the chat feature in delivery platforms are somewhat a new concept compared to JP where Uber provided this functionality

Possible action items

- Although only two participated, it would be beneficial to improve notification as a part of the test
 - Alert the courier with a sound
 - Include push notification for Android app when the app is in the foreground
 - Improve UI to amplify notification

- Monitor when we go nationwide to see if this is still an issue

Solution

UI Improvement (Figma)

- Legal
- Dev

Appendix:

1. Current notification policy:
 - a. Android
 - i. App Foreground
 1. In app message bar only
 - ii. App Background
 1. Push
 - b. iOS
 - i. App Foreground
 1. In app message bar + Push
 - ii. App Background
 1. Push
 - c. Sending push policy
 - i. If unread message is more than 1 and the customer sends more than 1 message in short period of time (5-10 mins), then only 1 push notification is sent (same as JP)
 - ii. When a customer sends the first message in the chat, push notification (and/or in-app bar if app is foreground) will always be sent

Notification of receiving messages in JP and KR

	Android KR	Android JP	iOS KR	iOS JP
Fore ground	In app bar (disappear after 5s) + Red dot In app bar appears again after 5s if a new message is sent regardless of previous msg being read	same as KR	Push sent with sound and vibration - only sent again if message is read Preview exposed In app bar + red dot Bar is exposed again if there is a new message regardless of the previous message being read or not	same as KR
Back ground	Push sent without sound and vibration Push is only sent for the first unread message (even if message is dismissed) Preview of the message is exposed	same as KR	Push sent with sound and vibration - only sent again if message is read Push not sent if message is unread Preview exposed	(same as KR) Push is sent No in-app bar and no red dot when app becomes foreground (same as KR)

App killed	Same as Android KR Background	same as KR	Same as iOS KR Background	Same as KR
