

KR Chat

Agenda

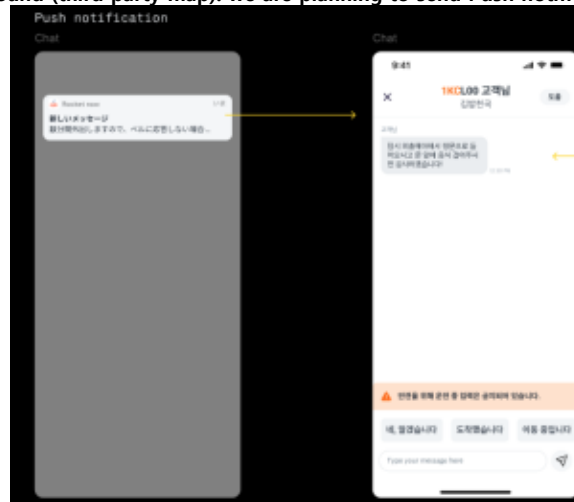

1. Why?
2. EDP flow walk-through
3. Previously addressed risks
4. Ways to mitigate the risks through Product
5. Additional risks?

Problem Statement

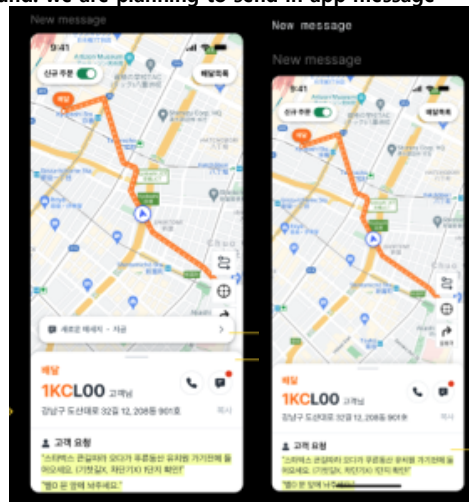

1. Currently there is only one way direction for communication between two parties, courier and customer via a call
 - a. Courier → Customer
2. When a call is made from a courier, his/her telephone number is exposed
3. We want to improve CS operational efficiency by reducing contract rate (number of calls / number of orders)

Policy

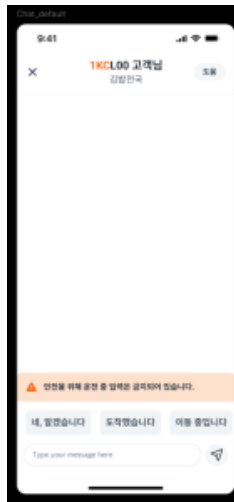

1. The possibility that EDP may get distracted by the message and accidents might happen
 - a. We are trying to minimise distractions as much as possible through suppressing chat notifications for orders that are not currently being delivered
 - i. Notifications will only be applicable for the current on-going order (*same as JP*)
 - Background (third party map): we are planning to send Push notification

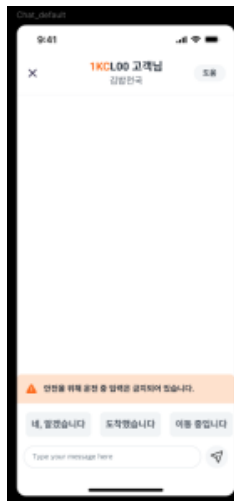

- Foreground: we are planning to send in app message

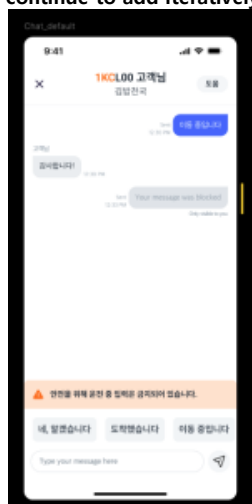

- b. We are providing a guide to not text whilst driving in all chat screens (*same as JP*)

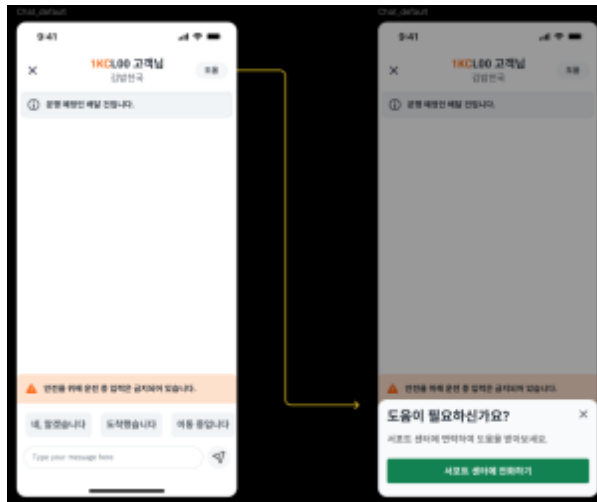

- c. Couriers can also utilise the quick response functionality to respond - allowing them to send messages quicker and more conveniently (*same as JP*)
- d.

- 2. The customer and EDP may get into quarrel or argument
 - a. We aim to block any language with profanity through a portal through a filtering capability (*same as JP*)
 - i. We can continue to add iteratively once live through operation and VoC's

- b. We are allowing users to have an option to call CS if the situation worsens (*same as JP*)

- c. We are not allowing attachments of images, videos, URL (*same as JP*)
- d. We are not allowing taking screenshots of the conversations
- 3. Possible conflict with government authorities, pushback from the rider union, or they may request additional hazard pay AND The fact that CS can access and see the communication between customer and EDP may be in violation of Protection of Communications Secret Act (Need to discuss the UX to avoid this.)
 - a. We will collect optional consent to Chat during on-boarding for new and existing couriers - designed on the basis we got from JP, but if there is a different requirement or terms from KR legal team, we can add/modify
 - i. New users (*same as JP*)

ii. Existing couriers

iii. Current JP Consent message:

- We will store all messages sent and received between chat parties and related metadata (date, time, sender, recipient, etc.) (the "Chat Data") for a certain period of time, and we may view this Chat Data in the event of a trouble or dispute between chat parties.
 - b. We are guiding not to expose personal information/secrets in all chat screens (*same as JP*)

Feedback (Key risks):

- EHS Legal, EHS,
 - Chatting whilst driving - only allow chat functionality when stationary
 - Receiving messages whilst on the move is acceptable
 - Likelihood of accidents significantly increase when texting and driving with one hand
- EL
 - Customer must not initiate the chat (Coupang Flex)
- PR/GR
 - Content communicated in the chat can be preserved for evidence which can lead to specific cases regarding disputes between two parties / used as a resource for negative media coverage / disclosed to the public (including internal policies)
- Privacy
 - Not a necessary feature for delivery - consent should be optional, and can be withdrawn at any time
 - Review against Telecommunications Privacy Protection Act, PIPS..etc needs to take place

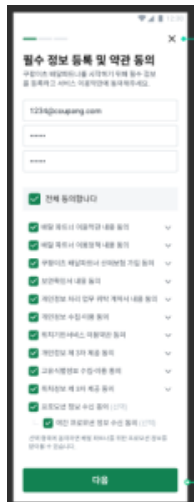

Ways to remediate the risks:

- Can receive messages but texting is prohibited whilst on the move (more than x km/h)
 - Or messages can be sent after courier is 'nearby' to its drop-off
- Courier will be the only party to initiate the chat
- Optionalising consent
- Chat functionality only provided to those who have given consent
- Consent and therefore the chat functionality can be withdrawn at any point in time, at the user's discretion
- Prevent taking screenshots within the EDP chat screen
- Prevent images/video/URL upload
- Filter key words that may potentially disclose our internal prohibited policy/information
- Request review regarding Telecommunications Privacy Protection Act, PIPs, Security, Consent text ..etc
 - Define retention period of storing the chat conversations..etc

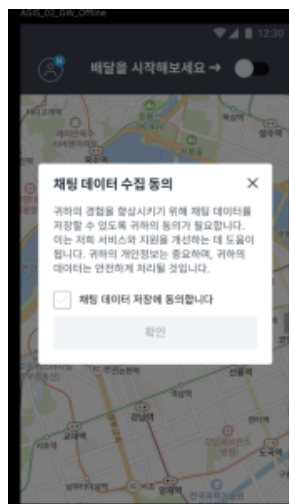

Product requirements based on feedback

Optionalising consent

- Consent to chat is optional
 - New users (EDP & 3PL) during sign-up: add an optional line within the onboarding flow

- If users do consent, chat functionality is enabled as soon as they are assigned to an order post food pick-up
- New users who have not given consent during onboarding flow OR existing users (who have completed more than 1 order)
 - Another consent non-mandatory banner (then pop-up) should be displayed when they enter the GW (identical to current JP version)
 - Users accessing the GW for the first time after Chat release, pop-up should appear for gaining their consent
 - Those who have not given consent (clicked on X) will have the same pop-up displayed on the GW every time they start the app with a new session (e.g. after killing the app) will have a blue banner displayed at all times

- Banner rank
 - Red → Yellow → Blue
 - Blue:
 1. Chat
 2. Address for insurance
- Phase 2) For couriers who have withdrawn their consent, the blue banner (and the pop-up) should not appear when they land on the GW page
 - they can only give consent during delivery
- Any users who have not given consent to GW pop-up
 - Another pop-up should be displayed on the beginning of when they enter the first chat screen via their drop-off screen during delivery
 - If users give consent, they are given access to view the message and the ability to respond
 - If users do not give consent, they are directed out of the chat page and back into the drop-off screen
 - Users can access the chat screen whenever and however many times they want and the consent pop-up will always appear until user gives consent
 - Customers will not have the functionality to send messages to couriers that have not given consent
- Any users who have not given consent can give consent whenever they wish to - required?
 - Under MyEDP > Settings, a new section must be created where users can give consent
 - Any couriers who have an on-going delivery is not able to give the consent
 - They must finish their delivery first
- Any users who wish to withdraw their consent
 - Under MyEDP > Settings, a new section must be created where users can withdraw consent
 - Any couriers who withdrew their consent will not be able to view/send messages with customers
 - Any couriers who have an on-going conversation and/or order delivery is not able to withdraw the consent
 - They must finish their delivery first
 - But they can be on-duty

- App logging required for optional consent
- Translation needs to be in KR, not JP

Blacklisting certain EDP's (and customers)

Courier

- Blacklisted couriers will not be able to access the chat (chat icon will not be visible in the EDP app)
 - Call to customer is independent of the blacklisting process (ie. not applied)
- They will be not be separately notified if they have been added/removed from the blacklist
- Users who delete their account will have their name removed from the blacklist
 - ie. courierID will not be saved on the blacklist when they terminate their account
- Couriers delivering to blocked customers will be notified that they will slow to respond and call to customer CTA button is exposed
 - Phase 2) that the customer has their chat switched off and call to customer CTA button is exposed - JP Parity
- Couriers who have been blacklisted, the customer will have their chat greyed out (disabled)
 - <https://bts.coupang.net/browse/EATSE-64597>
- Customers will not have the functionality to send messages to couriers that have been added to the blacklist

EDP

- Customer with consent -> Chat button enable
- Customer without consent -> Chat button enable -> Slow message will be shown after 5 mins

Customer

- EDP with consent -> Chat button enable
- EDP without consent -> chat button disable

Admin

- We must be able to add and remove any EDP's to the Chat blacklist on EOC (or Sendbird Admin? TBC)
- We can add or remove a courier to the blacklist only when they are not delivering (accept order → order complete)
- There will be no warnings before the courier is blacklisted
- There must be a permission group so that only selected internal Ops team can access and manage the Blacklist
- We must be able to inform any EDPs that they have been warned and after X warnings, they will be blacklisted (through SOP?) - TBC

SMS Reservation

- SMS Reservation button should be retained and exposed to all users as long as the functionality satisfies the condition to be displayed
 - ie. when customer selects the appropriate delivery request (send SMS when order complete)

(Phase 2)

- Not exposed for all EDP's who have access to the Chat and the Customer is also available for Chat
- Exposed for all EDPs who are blacklisted
- Exposed for all EDPs who has not or withdrawn consent
- Exposed for all EDPs who have access to the Chat but the Customer is not available for Chat

Region Testing

Given the KR feature will be tested on a regional basis, there can be cases that both EDP and customer can cross-border test and non-test region.

Test region is based on the drop-off address location - chat icon will be visible only if the drop-off address is within the testing region (probably 속초)

Chat icon

- The Chat feature icon is only exposed within the test region
 - Chat icon will be greyed out if the drop-off address is outside of the test region if the courier has seen the chat icon before
 - We will mark the courier (& customer) in the 'test list' when an order in test area has been picked up and after this

Consent

- Gain consent when courier enters the chat during testing phase
- Display pop-up on the GW every time they start the app with a new session (e.g. after killing the app), for couriers within the testing region and the neighbouring regions (x,y,z)
 - Region: Sokcho + x,y,z x

Everything else is the same as JP

EOC/admin will be covered by the Customer team - **TBC**

-

Metrics

Dashboard

1. Input metrics:
 - a. (conversation level:)
 - i. Number of Conversations: The total number of conversations that occurred.
 - ii. Average Messages per Conversation:
 1. User: The average number of messages sent by the user in a conversation.
 2. Rider: The average number of messages sent by the rider in a conversation.
 - iii. Keywords in Messages: Analysis of keywords in the messages, such as:
 1. Profanity
 2. ~~Complaints~~
 3. Instruction of routes, locations - P2
 - b. (Order level:)
 - i. Proportion of Orders with Conversations: The percentage of orders that included at least one message.
 - ii. Proportion of conversation initiators: the percentage of conversations initiated by users/couriers
 - iii. Average conversation time: from the time of first message to the time of last message
 - iv. Avg response time: How long will it take for the rider to respond to the user - from first Customer message to first EDP message
 - v. Timing of Conversations: The different stages during which conversations occur: (with order info, will be ready by 03 /11)
 1. After picking up the order
 2. After arriving soon
2. Success Metrics(AB Group):
 - Order Duration, avg, TP50/90/99
 - T2, avg, TP50/90/99
 - Part of T2: From courier arriving to order complete
 - ETA, ETA0.5. also see ETA0/1/2/3
 - Late Miss, ETA0.5 late miss. also see ETA0/1/2/3
3. Guardrail Metrics(AB Group):
 - (order level:):
 - ~~OD~~
 - Acceptance rate. (could chat affect the AR? in that there is a distraction when a new order comes in during the conversation)
 - (courier level): P1
 - Order count - since courier will spent some time in typing message, will the order completion count drop?
 - Unassigned count ~~for next order~~
 - Ignore rate ~~for next order~~
 - Number of Customer Support calls - P2
 - Onboarding complete rate - P2
 - Number of couriers withdrawing

App logging

Gaining consent:

- Onboarding flow
- GW pop-up
- Chat icon during delivery
- Blue banner ?

Chat

- Accessing the chat via banner vs icon vs push
- Calling the customer within chat page
- Calling CS within chat page

- Rate of Slow response message
- Quick response click

Metrics from App logging:

- Ratio of where EDPs give consent
- Ratio of where EDPs access chat
- % of chats that lead to customer calls
- % of chats that lead to CS calls

--

Next iteration ideas:

- Improving consent adoption rate
 - Too many banners
- Scope in the grey out of chat icon
- SMS reservation segmentation
- Design issue: https://coupang-corporate.slack.com/archives/C08LX3VKQ64/p1744188938772779?thread_ts=1744092583.043849&cid=C08LX3VKQ64
